X, Y and Z coordinate systems are supported in AutoCAD Plotted objects can be annotated with dimension and annotation bars Standard shape operations are available for layers, including cut, copy, move and rotate operations Powerful object selection and context menu AutoCAD LT supports the use of AutoLISP and VBA for customization. AutoLISP is also used for a number of built-in procedures such as inserting objects, text, and annotations. AutoLISP is also used for calculation of percent complete in the Quick Properties dialog box. AutoCAD's own scripting language AutoLISP provides designers with the ability to implement custom procedures and functions. The language is interpreted rather than compiled, as is the case with the more widely used Visual LISP. AutoLISP allows the construction of unlimited loops of custom procedures, called "macros", which can be implemented using subroutines and functions. The language also has a syntax similar to FORTRAN. AutoLISP allows the construction of unlimited loops of custom procedures, called "macros", which can be implemented using subroutines and functions. The language also has a syntax similar to FORTRAN. In comparison to VBasic, the most used scripting language in AutoCAD, AutoLISP is much more powerful. For example, while VBasic is restricted to the use of classes, which are typically implemented as ActiveX controls, AutoLISP allows them to be implemented as ActiveX controls themselves. There is a similar programming language called Visual LISP, which is also interpreted, but is closer to Visual Basic than AutoLISP. AutoLISP macros can be integrated with other custom AutoLISP procedures through both automated and manual methods. AutoLISP provides an "INSERT" procedure that allows developers to insert AutoLISP macros into their code as well as the standard Insert menu commands. The custom script language is extensible and the extensibility mechanisms allow custom macros to be implemented to add such features as code editing, continuous integration, and more. The scripting language has been described as having a low learning curve, "powerful, easy to use, and very customizable". Visio Visio supports a number of APIs, allowing users to automate custom functions or develop their own, such as menu bar icons, or application-specific functionality. Visio also uses the Microsoft a1d647c40b

Q: Getting Django to work in subdirectory with vcs How can I get Django to work in a subdirectory on a vcs git repository? I have a Django app that works well when deployed on its own repository, but fails when deployed on a subdirectory under a repository. My setup: git, subdirectory, Django project, production server Django project is in subdirectory foo, where the git repository is foo-trunk. Bar project is in subdirectory bar, where the git repository is bar-trunk. Production server is hosted on a completely separate machine. I did the following: git remote add production git push production master This pushed the code to production, and django exited with this error: Environment: Request Method: GET Request URL: Django Version: 1.3.1 Python Version: 2.6.5 Installed Applications: ('django.contrib.auth', 'django.contrib.contenttypes', 'django.contrib.sessions', 'django.contrib.sites', 'django.contrib.messages', 'django.contrib.staticfiles', 'django.contrib.admin', 'test') Installed Middleware: ('django.middleware.common.CommonMiddleware', 'django.contrib.sessions.middleware.SessionMiddleware', 'django.middleware.csrf.Csrf

AutoCAD's built-in capabilities to incorporate user feedback are significantly enhanced with the addition of Markup Import and Markup Assist. Markup Import supports importing and editing designs by automatically generating comments from a scanned copy of a paper or PDF document that has been placed on a scanner glass or printed on paper. Markup Assist improves how you use AutoCAD and its built-in capabilities. It allows you to import designs that are linked to a class or standard, modify the design, and send it back to the linked class. This functionality also now makes it possible to adjust your drawings after they are linked to a class, standard, or template. Linked Files for Circulation and Composition: The latest version of AutoCAD supports linking files and compositions to classes and standards. The new feature can save you time by providing you with a single source for changes and revisions. Linked files and compositions also keep the file, and its contents, consistent with the linked class or standard. For more information on AutoCAD linked files and linked files in other products, see our Product Support page. Linked files are stored in a special folder on your computer, called a Content Link Library. Each linked file is automatically named for its corresponding class. For example, the linked files for the architecture class will be named for that class, such as APATH-1.10.1. When you link a file to a class, you can open it in the correct named class by opening the Linked Library as shown below. Class navigation In addition to automatically naming files that you link, you can navigate directly to a linked file by following the steps below: Open the Architecture Class, and then open the linked file. navigate directly to the linked file Open the Electrical Engineering Class, and then open the linked file. navigate directly to the linked file For more information on AutoCAD linked files and linked files in other products, see our Product Support page. You can also create linked drawings that contain multiple linked files or linked files and compositions. For more information on creating linked drawings, see Creating linked drawings. New feature: Linked components in design objects: When you create a linked object, a reference to the linked file is automatically created in the component properties of the linked drawing, as shown below.
