The main results are due to John Lindgren, who in 1978 proved the following

theorem for all positive integers. Theorem. For the proportion of primes less than or equal to that are not congruent to modulo is as. For many years the formula (which is known to be true since the 1950s) was stated with an error of 0.001 or less, but more recent experimental results show that the error is around 0.0007, making the theorem an exact formula. Lindgren goes on to conjecture that the remaining primes are less than or equal to are congruent to modulo for all. He then further assumes the Riemann hypothesis, and goes on to conjecture that this additional assumption is unnecessary. Using Chebyshev's theorem, one can easily derive stronger results than the dispersive limit, as follows. Given a sequence of primes, we can construct a sequence of odd integers such that is always divisible by the second prime of the form Using the formula for the count of primes below in terms of, we see that. Thus, if is the correct analogue of the number of primes below, one has At this point, Chebyshev's theorem gives a polynomial that dominates, as is always odd. Thus, if is always greater than or equal to, then

by satish kumar pdf free downloadgolkes. .Q:  
How to get byte value in Tensorflow I have a  
numpy array of floating values. When I  
convert it to a Tensor, I get a TensorValue  
which has type tf.uint8. I want to know the  
value of the generated Tensor, like: 0 -> 0,  
0.1 -> 256, etc. I have tried to store the  
Tensor as a dense array: `x_dense =  
tf.constant(np.array(np.float64(data_array),  
dtype=np.float64))  
tf.convert_to_tensor(x_dense).eval()` but then  
it has type `tf.Dense(shape=(),  
dtype=tf.float64, name='dense/value')` which  
doesn't give me any information about the  
Tensor type. A: It sounds like the value is  
actually floating point rather than integer, but  
you do not say it. In any case, you could do  
the conversion explicitly: `x_value =  
tf.cast(tensor, tf.float32)` To answer your  
question, your dense array will be a tensor of  
type `tf.float32`. As a result, since the  
conversion is lossless, the result of the cast  
will be the same as the input. For example,  
the values 0, 0.1, 1, 1.1, 1.2 are all casted to  
the same value: 0. A: Update Nov 2020 The  
tensor in the answer by @Singhana works  
fine for the same input as the OP. The tensor-

value approach of @thealexk also works fine. The latter is the recommended approach, but

I have included it here to show that the numpy array approach is also valid. The original answer below is relevant for older versions of Tensorflow. Original answer: You can use the value attribute to access the numpy float elements: `import tensorflow as tf`  
`import numpy as np` `x = tf`
