There'd been some talk about using treacle instead of white treacle but I wanted to try treacle too. I'd originally meant to use the dark chocolate round, but just couldn't be bothered - this was the only round I had. So I changed to a yellow. I made the best ganache I've ever made, with only maybe 20g in the whole pot! 3 1/2 months of fridge time and nearly 2 kg of butter. Will have to make it again for my other cakes, as it was a fantastic effort. Must try and get the skin-coloured ganache made with some cocoa butter, and some dark chocolate in it. I think this is my second ganache that has worked out really well though. It's not quite so sweet - almost marzipan-like in feel. I made it for Scott's birthday cake, and set about a month before it was due to come out of the fridge, and it didn't seem to have lost any of its texture. The chocolate was white chocolate and it was allowed to set overnight in the fridge and I've got a feeling it will turn out really well. As for the cake, I thought it turned out ok, but I'm not sure if the manky ones can be saved. It's not too bad with a knife, but I'm not quite sure I'd buy it again. A lot of people seem to like the ganache, so I think the next one I make will be a lot more treacly, as the ones I'm going to make are going to be a

lot larger than this one, so the treacle won't be as strong. The batter was quite fragile, so it's easier to blame the cats than the batter. I definitely want to do a black treacle recipe next. Thanks for watching! Next time - vanilla! Mug cakes Copyright @ Rhineata 2007 - 10 d0c515b9f4

Consider this C code: #include int main() { char a = 0xAA; printf("%s", &a); return 0; } If I run the program, I get: AA This is good. The only problem is that if I want to print the most significant bit of the number, I have to get the byte after the number: #include int main() { char a = 0xAA; printf("%c", a & 0x01); return 0; } If I run the program, I get: 2 This is not good, as the single-byte representation of the number is actually 0b00001011. I want the output to be just 1, so that the number 0b00001011 becomes 0b00001101. How can I do this? Is it possible to do it in a single byte? A: As far as I know, this is not possible to do in a single byte. This would require to look at the value of the rest of the byte. unsigned char a = 0xAA; printf("%s", a & 0x01); A new milestone has been reached as the market for cryptocurrencies has now surpassed its earlier peak in late 2017. Blockchain has garnered much attention,

Yesterday, while viewing my Facebook news feed, I found a post from someone I am acquainted with and I clicked on it to see what was on their mind. The post was a statement that said it is time for Christians to make the

announcement that: "The Kids Are All Right!" I blinked, stunned. Someone I know had posted that the "kids are alright"! Yep, this really happened. Oh, wait. What if I don't believe in the concept of children and the family as a biblical reality? Am I like that person? Boom! I almost put down my glass of iced water and ran out of the house, and I had to walk over to a place that has the fastest internet service to make this post. Have you ever stopped to think about the "kids are alright" statement? I sure have. I read something about it in my personal reading from the past several years and I have questioned the statement. When I was in college and finally was able to have a baby of my own, it was so wonderful to me to see that statement holding true to the truth. I liked to think that meant so much to my friend as to remind them that the children are alright. Then I looked at my own children and saw that they are all
