"I wouldn't say it bothers me that much because I think it's obviously something that needs to be checked," Marchand said Tuesday after practice. "... It's something that he does. We're out there to be physical. He's a big guy. We're a team that likes to be physical. He's going to try and do the same thing. It's nothing I'm sorry for. I'm not. I'm not sorry for doing anything physical." Marchand was in the penalty box for 2:55 of 5-on-3 time. When he returned to the game, Marchand was assessed a double minor for high-sticking. Marchand said it's not a real concern. "It's just part of the game and it's tough when you have a guy like that coming at you," Marchand said. "We're just out there trying to play. We're getting pucks on net and things like that. You need to have that. I'm not really worried about the penalty. It's something that [Hockey Canada] does on their videos and stuff like that. It's not a big deal." Marchand did not face any supplementary discipline for the hit. Canucks defenseman Chris Tanev, who was penalized for boarding at 11:49 of the second period, served the same amount of penalty time. Marchand sustained a cut to his right elbow on the play. Canucks coach Willie Desjardins said Monday it was a grade two MCL injury, but did not know Tuesday if Marchand has fully recovered. -- Download the NHL app for iPhone/Android -- Follow Zack Cox on Twitter -- Like the NHL on Facebook

A: Post a bounty that triggers when an answer is posted! This way you can get around the automated system in a way that will get all the information you need. The present invention generally relates to a method of placing and/or removing a bent rod from a bending press. More specifically, the present invention provides an improved arrangement of control elements which release a bent rod from a bending press. Placing and removing bent rods, such as rod strips, from a bending press typically involve the use of small-diameter rollers, such as a roll chuck, which may be positioned within a horizontal hole of a bend-

plate of a bending press, where the bend-plate has a hole through which the rollers may be positioned. As a rod of material to be bent is fed into the horizontal hole, the rod passes between the rollers. When the rod is positioned between the rollers, the rollers apply rotational force to the rod and shape the rod into the desired configuration. As the rod passes through the vertical bend of the bend-plate, a longitudinal force is applied to the rod as the rollers compress the rod longitudinally along the axis of the rollers. As the rollers apply a force to the rod, a reaction force to this longitudinal force is applied to the bend-plate. If the bend-plate is a closed curve, it is compressed along its entire circumference, thereby increasing the diameter of the closed curve. If the bend-plate is not a closed curve, then the hole in the bend-plate is positioned such that it partially surrounds the curved configuration of the bent plate, leaving the desired portion of the bend-plate remaining free of a circumferential compression force. As the rod is fed into the bend-plate, the rod is positioned in such a manner that it comes into contact with the rollers located within the hole of the bend-plate. During this portion of the operation, the rollers apply both rotational force and a longitudinal force to the rod. Following this portion of the operation, it is desired to remove the bent rod from the bend-plate. Typically, this is accomplished using another pair of small diameter rollers to grip the rod and pull it out of the bend-plate hole. However, the rolls may fail to grip the rod if the bend-plate hole is not wide enough to accommodate the rollers. In order to use such a roller system, the bend-plate hole must be made larger to accommodate the roll
