A capillary zone electrophoresis method was developed for therapeutic drug monitoring of cotrimoxazole and its active metabolite, sulphamethoxazole in plasma. Cotrimoxazole (150 mg) was given orally in two equal doses at 8.00 a.m. and 6.00 p.m. Plasma samples were collected at 8.00 a.m. and 6.00 p.m. on the following day, to compare peak concentrations of sulphamethoxazole and cotrimoxazole. The plasma concentrations of cotrimoxazole (median: 2.17 microg ml⁻¹) and sulphamethoxazole (median: 1.64 microg ml⁻¹) were statistically significantly higher (P
