This invention relates to the generation of a rotating magnetic field for the purpose of energy transfer, in particular, the use of a rotating magnetic field as an energy transfer mechanism for the purpose of providing power to a prosthetic limb. The use of a prosthetic limb by a person with a limb loss is sometimes accompanied by significant discomfort and pain. The pain can be caused by several different reasons, for example, the mechanical problems in connecting the prosthetic limb to the person's residual limb, the load on the prosthetic limb caused by weight transfer from the person's residual limb, the lack of motion in the prosthetic limb and generally the sensitivity of a prosthesis to physical trauma. For example, instability, mechanical mismatch and co-morbid conditions such as diabetes can lead to problems with the residual limb, and the linkage to the prosthetic limb. The term "residual limb" refers to any part of the amputee's body that can sustain residual movements. The residual limb includes the part of the patient's limb, for example, the part of the limb directly below the transected part that has not yet been amputated, and the residual limb includes the stump of an amputee. For those with limb loss, the pain can be caused by both the residual limb and the prosthesis. Because the residual limb can be directly or indirectly attached to the prosthesis, a portion of the pain can originate from the prosthesis. The pain from the residual limb, however, is typically less intense because the residual limb is not mechanically connected to the prosthesis. Prosthetic pain can also cause acute pain or aching, swelling and other bothersome sensations that must be addressed. The prosthetic pain can be particularly noticeable when the person is using the prosthesis c6a93da74d
