In vivo detection of trypanosome infection by PCR: a quantitative test for *T. congolense*. We describe a simple and rapid method for detecting trypanosome infection in small animals by polymerase chain reaction (PCR) amplification of a variable portion of the kinetoplast DNA minicircle genome (34 fg). This test is quantitative in that the number of parasites in the blood is indicated by the number of specific amplification products. A single copy of the minicircle genome was present in both the bloodstream and the contents of a single leukocyte. The sensitivity of the test can be adjusted by monitoring the positive and negative amplification controls of the system on the gel. This has allowed the quantification of parasite loads in mice following experimental infection with varying doses of *T. congolense*. FILED NOT FOR PUBLICATION JAN 07 2012 MOLLY C.
