8Dio Studio Solo Violin Full Download.rar 0: How to keep separate from Python I am reading How to Think Like a Computer Scientist: Building the Foundation for Computer Science, and I am a bit confused by one of his diagrams. He has two different sections on different diagrams. He talks about the differences between separating and keeping separate. He says that something is kept separate when it is specific to a set of things or chunks of code, while something is separated when it is separated from the rest. He says that something cannot be kept separate from Python if it is Python code that is compiled to be a library to provide another program that can use it. So he says that taking a sequence of characters from a source file, say a Python source file called source.py, and taking a sequence of characters and compiling them into machine code that is a library to be used by another program is keeping something separate from Python. This is like saying that when you compose a song, you separate each note from the rest. So you have to take each note and separate it from the rest. This doesn't make sense to me. What is so different about these two things? A: In CS, separating means dividing up the work of a program so it can be executed more efficiently. It can be done at many levels, like for readability, or it could just mean a special part of the program's logic is converted to a library that can be used by another program. If you execute a bunch of statements, a loop, or a function, it is separated from the rest of the program because it could be executed more than once and there's no reason to keep the loop or function in the main program. However, if you have a bunch of logic that's related to each other, and you want to break it apart to improve performance, then you would divide it up. Maybe you would have a set of strings, which would be joined into a single string when all the functions are run, but that string is split apart after the fact. In CS, the latter is a way to keep the logic close together, in terms of order, but make it execute more efficiently. -70791 --70782.
