the main pros of oled is that they dont have a mechanical backlight which can get a bit dimmer and burn-in at times. with oleds however, the backlight is a power supply meaning that it doesnt get dimmer by design. but a newer type of oled that has been recently developed uses a backlight system called dynamic backlight scaling (dbs) which results in much brighter images. amoled 4k is considered to be the future of display technology and looks absolutely stunning and near photo like in all of the comparison below. while dolby vision has been around for a few years, it was only made available to 4k uhd discs from warner bros (a deal that came to an end earlier this year). with dolby vision, it is said that it is capable of providing more accurate colors than current hdr formats, and more lifelike than sdr color. if you want to play the demo, which is up now on amazon, you can try the dolby vision app here. the app does require a compatible blu-ray player that supports the dolby vision format, so if you plan to play hdr content on a tv or set-top box like amazon fire tv, etc, then you should check out all of the current dolby vision options available. on to the best examples of that comparison, first we go with the sony xl-a1c oled which is an excellent 40" 4k oled television with dolby vision support. keep in mind that dolby vision is not currently available to 4k uhd discs from sony or warner bros (in fact warner had already announced it was not going to be supporting dolby vision on their 4k ultra hd discs, but they have since reversed course). if youre looking for a video to stream, you can either look through the store for your favorite movies or tv shows, or download one straight from your video library. use the library icon to open the video library, where your full list of content can be viewed in streaming or downloaded format. if the video is already downloaded on your device, use the redownload tab to view the video and start watching it.
