The new Export module, which is the same as in Lightroom 4, once more works beautifully. It is one of the most useful and versatile modules in Lightroom, and it has also built on what it succeeded in providing during its last version, which is a No Compromise approach in the state of the art of photography. One of the great things about this module is that it is extremely customizable, and the choices the user can make are as numerous as they are complex. It is also something to keep in mind that the Export module comes first in the module stack when using imports. One thing Lightroom can't do in-app is make adjustments for the camera. Yes, you can open photos in Photoshop to do so if you want to, but it's not nearly as convenient. Adobe should really make a standalone Photoshop version or at least a la carte service like Photoshop Express. That said, because of the new Shared Media Library feature and the integration with cloud network storage, it's now incredibly easy to integrate photographs with other photos from your hard drive. If hundreds of images scan and are uploaded to cloud storage, it's easy to create a new library and link it to your hard drive. This allows you to access literally thousands of photographs, and makes sharing your photos between computers much more simple and effortless. Photoshop CC is a powerful, capable, and flexible tool for even the most experienced and new users. Every update since CS6 (released 2010) has made the app even better, and Lightroom 5 is no exception. The new Develop module, if I'm not mistaken, is one of the most important new features for the app in many years, and it makes perfect sense.

Is there a definitive guide, a video tutorial or some other resource out there that I can view or read? I realize it's a relatively complicated program for beginners, but I'm willing to learn. I also want to learn. I'm starting with a rather simple task of creating a simple mock up website, but I'd like to make a couple of web-based applications as well.
