Whether you are curious what changed on your system or you need to trace someone's activity on a computer, What Changed can be an excellent addition to your arsenal of tools. At first glance, What Changed does appear to be a rather simple tool, but it's actually a very detailed application in disguise. The program creates a system snapshot and saves the current status of the system, while the second step is all about comparing the new data with the previously-collected one. There are no secondary configuration options and that's a good thing for rookies, as figuring out the way the app works may be a little difficult in some cases. You're allowed however to copy file changes to a new folder and clean temporary files. The software comes in a ZIP archive, which means that no installation is needed, regardless of the Windows version running on your system. What Changed comes as a single executable file, so you don't have to unpack it. General Even though What Changed is fairly bare-bones, the application does provide some interesting features. In terms of options, there are two: choose which files and registry entries you want to track and specify the path where the information is saved. Additionally, you are allowed to set the number of days and the number of hours in a 24-hour period that changes will be recorded. There are also three separate, but closely related, features which can be selected to customize the software. For example, you can choose to exclude some files from the monitoring, record just changes to a single file type or filter out certain file types entirely. Finally, What Changed is a standalone tool that doesn't rely on any other applications and, therefore, requires no prior installation. Usage First

of all, what's the purpose of What Changed? Well, it's rather simple. You can use this tool to keep an eye on the files and registry changes that happen on your system. If someone is tampering with your computer, this program will be able to show exactly what happened. Of course, if you're looking to follow someone's activity, What Changed won't do the trick. The only way to get the program to track activity on your system is to manually configure it, so you'll need to manually go through every file and make sure it's in the right place.
