I'm really excited to take Lightroom for a test drive with Adobe. Thirteen years on and a perennial favorite inside Adobe is still, in my view, the best piece of the overall photo workflow puzzle. I think it's about time the company made some new tools for images. With Lightroom for iOS, as with tablet photography more broadly, there's the opportunity to make something new or extend something old into something new. What's the real point of Lightroom? My advice? The point is that it's a tool that lets you take a few minutes to organize your photos, pick the ones you love the most, and refine them into beautiful masterpieces. I obviously prefer selecting the best images in the viewfinder, and then then selecting the best individual images in a print layout, but Lightroom offers far more than that basic task. I'm pleased to see that the features with the standard license are pretty comprehensive, and that the price is significantly lower than Adobe's standalone Photography and Creative Cloud packages. And while you would hope that the upgrades wouldn't be left all to Adobe, they have improved the mobile version of Lightroom for iOS. Looking at the list of changes, there are a number of small upgrades and additions: &#rdquo;Artistic&#rdquo; filters, adjustable curves, keywords and Global Lightroom adjustments, Create360 VR tools, "Camera Raw" presets, and I'm especially happy to hear that the Duotone color palette can now be effectively edited. With 64-bit support, full library organization, and a full color scanner, Lightroom for macOS continues to be the best digital photo tool on the planet in almost any setting. And free upgrades keep it an absolute top choice.
