For Youtube videos owner, is necessary to add the following video link: Dlscd.video.youtube.com You cannot remove the link to this video.1. Field of the Invention The present invention relates generally to masonry edging and sealants and, more particularly, to masonry edging and sealant systems and methods for protecting outdoor stone-faced structures, such as, for example, homes, office buildings, and the like, from moisture, air, insects, and wind. The present invention also relates to single-component aqueous masonry sealants and methods of their manufacture and use. 2. Description of the Related Art Stone-faced structures, such as buildings and sidewalks, are susceptible to problems related to poor weather resistance. Building and sidewalk stone is porous and moisture that migrates into the pores quickly dries out and cracks can form. Moisture is also difficult to remove from stone-faced structures and stone slabs tend to have seams that can become air spaces. As a result, moisture tends to migrate into these spaces and the stone becomes damaged. Fiberglass felts are commonly used as back-up barriers to the stone faces of buildings and sidewalks to prevent or inhibit the migration of moisture. A variety of fiberglass felts have been developed that serve as barriers to moisture. The glass fiber mats generally are positioned on a building or sidewalk structure and secured in place by masonry caulking or by masonry ties. Masonry caulking is generally used to close gaps between adjacent slabs of building or sidewalk stone, while masonry ties are used to secure adjacent slabs in place. Glass fiber mats tend to be susceptible to cracking when placed in certain circumstances. Moisture can migrate into the stone-faced structure
