With that said, let's start with the biggest issue left open by Lightroom 5: Photoshop CS6's In-Place editing capability. Start-ups after learning the functioning of Lightroom have been a bit shy around Photoshop's slicker, lighter-looking editor, thinking it's unwieldy. Since CS6 launched, In-Place editing, as it is now called, has been sorely lacking. Each version of the visual tool has represented the latest version of Photoshop, which only served as a nod to CS6's bold visual overhaul. In place editing requires a whole slew of permissions from a user. Not only does the user need to allow the In-Place editing tool to access data on the computer, but they also must sign out of the "desktop" version of Photoshop, so that In-Place editing can be performed. It is not disabled by default and, of course, users can still go through and modify the original document in place. It is disabled when an image is abandoned (complete, but no longer in editing) or when user A changes the original data in place and a new image is opened. It is a fairly strong and mature functionality that we want to retain, but failure to provide it as a stand-alone application is unfortunate. But the problem with the inability to have multiple people work in the same document--user B could work on a photo and when finished, close the document and then user A

opens it--is not that much of an issue. User A can then document a new state of the image, if they already know the original state of the image, or can simply redo what work was done the first time. This is not something that any truly advanced user would need anyway. But one may want to be able to replace an older version of an image, if they know there is, for instance, a slight mistake in a graphic element and want to do it over if for no other reason than they feel it will be faster to get the job done.

You can also use the *Layer* tab to add new layers to the image. Or you can add a new layer by pressing the *L* key on your keyboard to create a new one. You can also add a new layer by clicking the tab in the bottom-right corner of the editor. **NOTE:** To add an *active* layer, click its icon. Once there is an active layer on a layer, you can add a new layer by clicking the tab in the bottom-right corner of the editor. This will then make the layer below it on the active layer list two new layers. This is the opposite of adding a layer by clicking *L*. In addition to layers, you can also add *textures* (sort of like a stencil for the painted layer). And you can add both a mask and a clipping mask. A mask, when applied, will help control what you see on the layer. A clipping mask is just that; it controls what gets pulled up and shows on the layer. These two things are very useful. You can use a variety of tools to change the paint on the created layer. You can add or delete a brush. You can add a new stroke and use the paint bucket (for filling) or the brush (to add color). You can move the paint around with various tools in the **hand** tool. **NOTE:** You can also make your own custom brushes by adding texture, size, and shape. These custom brushes appear on the *Brushes* tab, just like in the built-in brushes that come with Photoshop. You can even draw a drawing shape on the canvas. Then, you can edit that drawing shape with the shape tools or create a new shape with selections tool. These tools let you create your own design with a shape and then edit it to your liking, and even crop the image if the shape is not usually used for a specific design. e3d0a04c9c
